

The system is a modular and adjustable slab track system that allows for the construction of a railway which facilitates a smooth journey for railway passengers.

The Bridgeless Protocol enables secure, chain-agnostic token bridging across blockchains using validator consensus and threshold cryptography.

Pandrol QTrack[®] can be integrated and designed to match any track finishing. It can be installed in grooved and vignole rails for a range of applications, from tramway to heavy haul projects.

When a validator receives a bridging request, it stores it locally and processes it using the Bridgeless protocol. The main bridge protocol is executed by the Bridgeless validators. It consists of ...

Numerical examples are presented to illustrate and compare the dynamic characteristics of the three types of track structures under various track irregularities, vehicle speeds, fastener ...

What Bridgeless Does Bridge assets between Bitcoin, Ethereum, Solana, TON, and privacy chains through one protocol with its own settlement layer.

This system is designed to ensure maximum reliability on at-grade tracks accessible to road vehicles, offering a durable and sustainable solution for railway crossings.

Pandrol QTrack[®] can be integrated and designed to match any track finishing. It can be installed in grooved and vignole rails for a range of applications, from tramway ...

You take no chances with these systems, especially with newly constructed lines: even at speeds over 300 km/h, your coffee will stay in your cup. Practically maintenance free, ballastless track systems ...

The Bözberg/STEDDEF system consists of twin sleepers that are connected by a steel track rod and enclosed in a rubber shoe. All of its components can be exchanged individually.

The seismic response of the CRTS II track system was firstly analyzed and then the influences of different cases of damaged track plate, base plate, and mortar layer ...

In this paper, a quarter-scale specimen of a prestressed simply supported concrete box-beam with CRTS II (The China Railway Track System Type II) ballastless track was constructed. A ...

A collision model of CRTS II track system which considered the nonlinear constraints between the track

layers was established. The seismic response of the system was analyzed and the ...

Taking the floating slab track system on the bridge as an example, the influence of train speed, fastener stiffness and the density of the floating slab on the dynamic characteristics of the train-track-bridge ...
