

Fiber optic switches have VLANs

The switch should treat the fiber interface like any ethernet interface, so you'll be able to do VLANs. That being said, if you're going through the effort of digging a trench, you should lay multiple strands.

This example describes how to configure the interfaces, VLAN, and FC fabric to connect FCoE devices to the FC switch and route traffic between the VLAN and FC interfaces:

This chapter describes how to configure Fibre Channel over Ethernet (FCoE) VLANs and virtual interfaces on Cisco Nexus 5000 Series switches. It contains the following sections:

Whether you're upgrading a managed network switch in a smart city, installing managed switches for command and control systems in a military environment, or using fiber optic managed ...

I purchased two M4300-24X24F switches that are going to be placed at each site with a fiber trunk connecting the sites. I have three total VLANs configured (4 if you include VLAN 1) on ...

Layer 3 switches allow businesses to expand their networks efficiently by supporting multiple VLANs and dynamic routing protocols such as OSPF and BGP. This makes them ideal for organizations ...

Fiber to copper converter doesn't have anything to do with vlans. If you have multiple vlans between the switches, then you need to make the link a trunk link with .1q encapsulation.

For any switch-to-switch connection, there can be a maximum of 1 vlan untagged. You can have 0 to n vlans tagged. Both ends of the connection must be configured the same for traffic to pass ...

When traffic travels between switches over fiber, optical modules such as SFP or SFP+ transceiver usually carry trunk traffic. That means multiple VLANs share the same fiber link and the ...

We will detail below what are the VLANs of the main fiber optic operators in Spain. With this information you can configure your neutral router in the way we mentioned the steps in the previous point.
