

Hydrogen concentration analyzed by spectrometer

Here, methods to overcome these challenges are demonstrated with an application of Raman spectroscopy to monitoring hydrogen isotopes with varied speciation within dynamic gas ...

This study explores the analysis of hydrogen gas from a distance using a Raman lidar spectrometer. Hydrogen gas is a flammable gas with risk of explosion, making accurate and quick ...

This manuscript offers an exhaustive investigation into hydrogen-sensitive materials and their incorporation into fiber-optic hydrogen sensors. The research profoundly analyzes the sensor ...

ctrometry with electron impact ionization. The vacuum setup was specifically designed for the light gas hydrogen. Application areas for the real-time measurement of hydrogen are safety tests and the ...

We investigated the suitability of feedback-assisted multipass spontaneous Raman scattering for this task and examined the precision with ...

We investigated the suitability of feedback-assisted multipass spontaneous Raman scattering for this task and examined the precision with which hydrogen can be sensed at concentrations below 2 parts ...

The nuclear resonance analysis-Rutherford backscattering spectroscopy (NRA-RBS) and secondary ion mass spectrometry (SIMS) are two classic techniques to analyze composition of solid surfaces and ...

The Thermo Scientific™ ESCALAB™ Xi+ X-ray Photoelectron Spectrometer (XPS) Microprobe can be used to detect and quantify the presence of hydrogen in the near-surface region of a sample.

hydrochlorination. Hydrogen is a concerning by-product because it is flammable and explosive at concentrations as low as 4% in air. The lower explosive limit (LEL) reported by the National Research ...

The present work focuses on the development of a calibration approach for Raman spectroscopy (RS) for the determination of the concentration of dissolved hydrogen (H₂) in bicyclic ...
