Draka Single-Mode Fiber (SMF) provides optimum performance in both the 1310 nm and 1550 nm wavelength operation ranges (including the 1565 - 1625 nm L-band), with a low dispersion in the ...

The maximum speed of single-mode (SM) fiber is determined by the bandwidth and transmission capacity of the fiber. Single-mode fiber can typically support speeds of up to 100 Gbps ...

Overview Characteristics History Connectors Fiber optic switches Quadruply clad fiber External links Unlike multi-mode optical fiber, single-mode fiber does not exhibit modal dispersion. This is due to the fiber having such a small cross section that only the first mode is transported. Single-mode fibers are therefore better at retaining the fidelity of each light pulse over longer distances than multi-mode fibers. For these reasons, single-mode fibers can have a higher bandwidth than multi-mode fibers. Equipment for single-mod...
