

A DLR network with redundant gateways uses multiple switches to provide multiple connections from a ring to the outside network. Redundant gateways are not essential if you need ...

Network loops can cause network storms if ring management is not employed. When an unmanaged switch receives a broadcast or multicast packet, it repeats these packets out every port ...

In a Cyber-Ring network, every switch or network node has two adjacent neighbors for communication purposes. Cyber-Ring supports a variety of ring network topologies including Single Ring, Ring ...

Depending on their firmware capabilities, both devices and switches can operate as supervisors or ring participants on a DLR network. Only some DLR devices, such as switches, can operate as ...

May not be any easier within your current network and would likely require readdressing many of your devices. Depending on what your physical topology is, if it is one large ring, you might ...

When the ring is closed it is in the normal state, and the switch sends data to the devices in the ring through only one of the two ring ports. The switch manages the physical ring as a single ...

Lately I've been struggling with a ring network made up of 9 switches. Switch sitting at the NOC is root bridge with priority 0 and everybody else is at 32xxx.

Ethernet ring protection (ERP) switching, is a widely-used technology in the core, distribution and access network layers of telecommunication networks providing fast sub-second convergence and low ...

Several proprietary ring protocols offer enhanced recovery times, loop protection, and network resilience. In the subsequent sections, we will explore each protocol in more detail and ...

Ethernet ring protection switching (ERPS) helps achieve high reliability and network stability. Links in the ring will never form loops that fatally affect the network operation and services availability. The basic ...
