

A PDU distributes power to multiple devices in a rack or data center. Learn how they work, the different types available, and what features matter most.

A Power Distribution Unit (PDU) is a specialized electrical device designed to distribute power from a single input source to multiple output receptacles, specifically engineered for data center and IT ...

A Data Center PDU is a data center power distribution unit that has been written about and randomly capitalized, most likely by a well-intentioned but semi-literate engineer.

A power distribution unit (PDU) is a device fitted with multiple outputs designed to distribute electric power, especially to racks of computers and networking equipment located within a data center.

What Is a PDU in a Data Center? A Power Distribution Unit is responsible for delivering electrical power from an upstream source--such as a UPS or power panel--to IT equipment within ...

A Power Distribution Unit (PDU) is a device that helps manage the flow of electricity within a data center. It takes power from a main supply and distributes it to equipment like servers, routers, ...

In a typical Data Center power chain, PDUs follow UPS systems and generators, providing the final point of distribution before reaching Remote Power Panels (RPPs) or directly to equipment.

A power distribution unit (PDU) is a device for controlling data center electrical power. The most basic PDUs are large power strips without surge protection. They are designed to provide ...

A PDU (Power Distribution Unit) in a data center distributes electrical power from upstream sources such as UPS systems or generators to servers, storage, and networking ...

What Is a PDU? A Power Distribution Unit (PDU) is an electrical device that distributes power from a primary source to multiple downstream components. In data centers, PDUs connect ...
