

Our complete optocouplers guide covers what they are, how they work, the different types, and key applications. Learn to select the right opto-isolator.

Optocouplers are available in four general types, each one having an infra-red LED source but with different photo-sensitive devices. The four optocouplers are called the: Photo ...

An optocoupler consists of two main parts: a light-emitting diode (LED) and a light-sensitive receiver, such as a phototransistor. These components are ...

Photocell optocouplers, also known as resistive opto-isolators, represent the earliest optocoupler design. They use an incandescent light bulb, neon lamp, or LED as their light source, and a cadmium sulfide ...

Optocouplers provide a high degree of electrical isolation and are therefore used extensively in commercial electronic equipment. Variations in optocouplers come from the type of ...

Optocouplers are very simple hybrid devices, consisting of an LED assembly, mounted on a carrier, with a silicon integrated circuit containing a photodiode and transistor (or high-speed amplifier).

Optocouplers are available in four general types, each one having an infra-red LED source but with different photo-sensitive devices. The four ...

Photocouplers (also known as optocouplers) generate light by using a light-emitting diode (LED) to generate a current which is conducted through a phototransistor.

Some optocouplers have a reflective pair configuration. This configuration refers to optocouplers that contain a source that emits light and a sensor that only detects light when it has reflected off an object.

An optocoupler consists of two main parts: a light-emitting diode (LED) and a light-sensitive receiver, such as a phototransistor. These components are housed together in a single ...

Most optocouplers use a special polymer, like Polyimide (PI), to create this gap. This polymer is an excellent insulator and prevents any current from leaking across.

It's commonly used in applications where safety, signal integrity, and noise reduction between different parts of a circuit are critical. For instance, they're used in power supplies, ...
